

fire::IParser

```
graph BT; A[fire::DelimitedTextParser< T, K >] --> B[fire::LocalParser< T >]; B --> C[fire::ILocalParser< T >]; C --> D[fire::IParser];
```

The diagram illustrates a class hierarchy for parsers. At the base is the class `fire::DelimitedTextParser< T, K >`, which inherits from `fire::LocalParser< T >`. This, in turn, inherits from `fire::ILocalParser< T >`, which finally inherits from the abstract base class `fire::IParser`. The base class `fire::IParser` is enclosed in a dashed box, indicating it is an abstract class.

fire::ILocalParser< T >

fire::LocalParser< T >

fire::DelimitedTextParser< T, K >
